Hardware

On Board Signal Processing and Analysis

ZT-Series DSOs include an on-board DSP for signal processing and analysis capability that shortens test cycles and reduces the need for user developed signal processing algorithms. The on board capability is much faster than processing on a separate PC or controller. It also removes the need to transfer large amount of waveform data to an external PC or controller and thereby speeding up post capture analysis. The on board DSP and analysis capability ranges from performing basic mathematical functions to the more complex computations like Fast Fourier Transform (FFT), derivative, integration, histogram, limit testing, mask testing, waveform parameter trending.

On Board Memory

ZT462x DSO provides a significant amount of flexible segmented on-board memory. Segmented memory allows waveforms to be saved on the DSO memory for later analysis and viewing. The memory segments can be viewed either overlaid or individually.

Software

Driver

ZT462x DSO instruments are operated with ZT-Series Driver software that includes API function calls or SCPI commands. The driver can work with the most commonly used application development environments like Microsoft Visual Studio® and LabWindows™/CVI for TPS development or be integrated with 3rd party tools like LabView™.

Easy-to-Use Graphical User Interface

The ZT462x driver software suite includes a Graphical User Interface (GUI) called ZScope™. ZScope is an intuitive software interface that provides manual instrument control and a user experience similar to that of a benchtop oscilloscope. Using ZScope, no more than two clicks are required to access all oscilloscope functions. In addition to the standard oscilloscope measurement functions, ZScope includes built-in advanced measurements such as: limit testing, histogram, FFT, filtering, SNR, spurious free dynamic range, ENOB, total harmonic distortion, measurement trending, and SINAD to name a few.
